Python TBA

Q. What is Numpy ? Create array using Numpy

→ Numpy is used to work with arrays. The array object in Numpy is called as ndarray.

We can create a Numpy ndarray object by using the array() function.

To create a Numpy array you can use function np.array(). All you need to do to create simple array is pass a list to it. If you choose to, you can also specify the type of data in your list. You can find more information about data types here.

Ex.

```
import numpy as np

arr = np.array ([1, 2, 3,4,5])

print (arr)

print (type(arr))
```

type() : It is built in function tells us the type of object passed to it.
